Outline

- Decycling Problem and Applications
- Obecycling Number and Cycle Packing Number
- Decycling Number on Graphs
 - Path Product
- Decycling Number on Digraphs
 - Generalized Kautz Digraph
 - Generalized de Bruijn Digraphs
- Objective Work

イロト イヨト イヨト イヨト

Definition (Decycling Problem)

Given a directed/undirected graph G = (V, E), find a minimum set $D \subset V$ such that $G \setminus D$ is acyclic.

Has applications in

 Deadlock prevention in operating systems (Wang et al. 1985; Silberschatz et al. 2003)

Definition (Decycling Problem)

Given a directed/undirected graph G = (V, E), find a minimum set $D \subset V$ such that $G \setminus D$ is acyclic.

Has applications in

 Deadlock prevention in operating systems (Wang et al. 1985; Silberschatz et al. 2003)
 Example: An operating system schedules different processes.

Process A is waiting for the resource on Process B so it can't release its own resource.

<ロト < 回 > < 回 > < 回 > .

Definition (Decycling Problem)

Given a directed/undirected graph G = (V, E), find a minimum set $D \subset V$ such that $G \setminus D$ is acyclic.

Has applications in

 Deadlock prevention in operating systems (Wang et al. 1985; Silberschatz et al. 2003)
 Example: An operating system schedules different processes.

Process A is waiting for no resource so it can release its resource.

<ロト < 回 > < 回 > < 回 > .

Definition (Decycling Problem)

Given a directed/undirected graph G = (V, E), find a minimum set $D \subset V$ such that $G \setminus D$ is acyclic.

Has applications in

 Deadlock prevention in operating systems (Wang et al. 1985; Silberschatz et al. 2003)
 Example: An operating system schedules different processes.

Deadlock:

Competing actions are each waiting for the other to finish, and thus neither ever does. **Solution:**

Remove some processes to **break such cycles** and put them in a waiting queue.

• Consider planar graphs:

Jones' Conjecture (Kloks, Lee and Liu 2002)

For every planar graph G, $\nabla(G) \leq 2\nu(G)$.

Theorem (Chen, Fu and Shih 2010, TJM)

For every planar graph G, $\nabla(G) \leq 3\nu(G)$.

<ロト < 回 > < 回 > < 回 > < 回 >

Consider outerplanar graphs:

Theorem (Kloks, Lee and Liu 2002)

For every outerplanar graph G, $\nabla(G) \leq 2\nu(G)$.

An outerplanar graph G is called *lower-extremal* if ∇(G) = ν(G) and *upper-extremal* if ∇(G) = 2ν(G).

・ロト ・聞 ト ・ 臣 ト ・ 臣 ト … 臣

Consider outerplanar graphs:

Theorem (Kloks, Lee and Liu 2002)

For every outerplanar graph G, $\nabla(G) \leq 2\nu(G)$.

- An outerplanar graph G is called *lower-extremal* if ∇(G) = ν(G) and *upper-extremal* if ∇(G) = 2ν(G).
- Upper-Extremal Results:
 - We define a *sun graph* S₃ as follows.

イロト イポト イヨト イヨト

•
$$\nabla(S_3) = 2 = 2\nu(S_3).$$

Theorem (Chang, Fu, Lien, 2011, JCO)

An outerplanar graph G is upper-extremal if and only if G is an S_3 -tree.

A graph is an S₃-tree of order t if it has exactly t vertex-disjoint S₃-subdivisions and every edge not on these S₃-subdivisions belongs to no cycle.

・ロト ・聞 ト ・ 国 ト ・ 国 トー

Theorem (Chang, Fu, Lien, 2011, JCO)

An outerplanar graph G is upper-extremal if and only if G is an S_3 -tree.

- A graph is an S₃-tree of order t if it has exactly t vertex-disjoint S₃-subdivisions and every edge not on these S₃-subdivisions belongs to no cycle.
- Example:

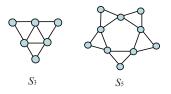

An S₃-tree G of order 3, where $\nabla(G) = 6 = 2\nu(G)$.

<ロト < 回 > < 回 > < 回 > < 回 >

Lower-Extremal Results:

The following graphs are NOT lower-extremal (∇(G) ≠ ν(G)):
 Sun graphs S_k with odd number k:

イロト イポト イモト イモト

•
$$\nabla(S_k) = \lceil \frac{k}{2} \rceil$$
 and $\nu(S_k) = \lfloor \frac{k}{2} \rfloor$.

Theorem (Chang, Fu, Lien, 2011, JCO)

For an outerplanar graph G, if G has no S_k -subdivision for all odd number k, then G is lower-extremal.

・ロト ・聞 ト ・ 国 ト ・ 国 トー

Lower Bound of Undirected Graphs

Lemma (Beineke, 1997, JGT)

If *G* is a connected graph with *p* vertices (*p* > 2), *q* edges, and maximum degree Δ , then $\nabla(G) \ge \frac{q-p+1}{\Delta-1}$.

Proof.

Suppose not.

Assume that $\nabla(P_m \Box P_n) = f_{m,n} = F_{m,n}$ and *S* is a decycling set with size $f_{m,n}$.

By above Proposition, we may let $v_{i,1}$ be the vertex of *S* with degree 3 where $2 \le i \le \lfloor \frac{m}{2} \rfloor$.

Let $v_{i,1} \in S, 2 \leq i \leq \lfloor \frac{m}{2} \rfloor$. $v_{m-1,2} \in S$ and $v_{m-1,3} \notin S$. $v_{m-1,2}, v_{m-1,4}, \cdots, v_{m-1,n-1} \in S$. Hence, n-1 is even and n is odd.

Proof.

Suppose not.

Assume that $\nabla(P_m \Box P_n) = f_{m,n} = F_{m,n}$ and *S* is a decycling set with size $f_{m,n}$.

By above Proposition, we may let $v_{i,1}$ be the vertex of *S* with degree 3 where $2 \le i \le \lfloor \frac{m}{2} \rfloor$.

Similarly,

 $v_{m-3,n-1}, v_{m-5,n-1}, \cdots, v_{2,n-1} \in S.$ Thus, *m* is odd, a contradiction.

Construction Method

Lemma

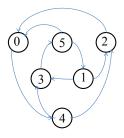

Let *S* be a set of vertices in a digraph *G*. Then *S* is a decycling set of *G* if and only if we can find a sequence of subsets of V(G), $S = S_0, S_1, \dots, S_t = V(G)$ such that (1) $S_i \subseteq S_{i+1}$; and (2) $N^+(S_{i+1} \setminus S_i) \subseteq S_i$ for $i = 0, 1, \dots, t-1$.

Objective Work

- For a planar graph G, $\nabla(G) \stackrel{?}{\leq} 2\nu(G)$ (Jones' conjecture 2002).
- For a planar graph G, $\nabla(G) \stackrel{?}{\leq} |V(G)|/2$ (Albertson and Berman 1979).
- For a bipartite planar graph *G*, $\nabla(G) \stackrel{?}{\leq} 3|V(G)|/8$ (Albertson and Berman 1979).
- We have $\lceil \frac{(m-1)(n-1)+1}{3} \rceil \leq \nabla(P_m \Box P_n) \leq \lceil \frac{(m-1)(n-1)+1}{3} \rceil + 1$. Find the exact value of $\nabla(P_m \Box P_n)$.
- Find the lower bound of directed graphs.
